

## No Needle Anesthesia for the Scalpel-Free Vasectomy

### *Now vasectomy can be a truly "pain free" procedure*

It is widely agreed that vasectomy is the safest and most affordable method of birth control for couples that desire no further children. And, it is estimated that approximately 500,000 American men choose vasectomy each year. However, the fear of pain from needles is still the greatest deterrent for most men considering vasectomy. To solve this, Drs. Burrows and Marks, of the Arizona Center for Vasectomy & Urology, are the first doctors in the region to introduce a breakthrough technology that eliminates the use of needles and allows men to have a virtually painless vasectomy experience.

Drs. Burrows and Marks are now using the MadaJet™ injector to apply local anesthesia to the skin and vas deferens without any needles. The jet injector looks like something from Star Trek and feels like a "flick" on the skin. The anesthesia works within seconds. Then the vasectomy can be performed quickly with no pain. By eliminating needles there is far less trauma to the tissue, the vasectomy can be completed more quickly, and the healing process is faster, often with no post-vasectomy discomfort whatsoever.

Drs. Marks and Burrows have performed 1,000s of vasectomies in Tucson and feel that this new no-needle injector is "leaps and bounds better than any previous technique," according to Dr. Burrows. Compared to using needles, the no-needle technique reduces anxiety and pain and results in rapid healing. Their patients are already reaping the benefits.

For more information and/or comments from the doctors or their patients, please call Dr. Burrows at: 520-731-0600.
